

# tGt Whitepaper

From a Failed Decentralized Slot Game to a Transparent Meme with Real Code

## Introduction

tGt is a transparent, ownerless blockchain experiment. This document openly describes its journey, including both ambition and failure.

## Project Origin

tGt originally aimed to build a fully decentralized on-chain slot game with provably fair logic. Due to architectural, UX, and sustainability limitations, this goal could not be achieved at the desired standard.

## The Pivot

Rather than hiding failure, the project pivoted openly and embraced a meme identity while continuing to ship real, immutable smart contracts.

## Vision & Philosophy

tGt prioritizes transparency, code over promises, and long-term trust over short-term speculation.

## Token Overview

ERC-20 token on Ethereum Mainnet. Fixed supply of 1,000,000,000 tGt. No inflation, no taxes, no privileged controls.

## Distribution & Locking

Tokens are distributed and locked via on-chain smart contracts including Random Reward Programs, Team Vesting, and Developer Vaults.

## Smart Contract Architecture

Ownerless, immutable contracts with no admin keys, no proxies, and no emergency withdrawals.

## Market Approach

tGt will only be tradable after infrastructure is tested, documented, and transparently shared with the community.

## Disclaimer

tGt is experimental. No profit guarantees. Users must verify all contracts independently.

## Conclusion

tGt is not a perfect story. It is an honest one. Code first. Honesty always.
